

AIRSTRIP REQUIREMENTS

- Availability of close, accessible and well maintained airstrips is crucial to efficient and safe aerial sowing / spraying operations. **CLOSE PROXIMITY WILL SAVE YOU \$\$\$**
- Airstrips need to be a flat surface of 800m – 1000m and a minimum of 50m wide with no obstacles (trees, powerlines or houses). A large grader should be used to smooth the strip. This is best carried out in autumn to allow establishment of selected grasses and settling.
- Grasses need to be cut prior to strip use.
- Consult us for inspection of your airstrips at any time required.
- Airstrip should be within 3km of the treatment area to avoid surcharges.
